

Good morning, everyone. I am Joy Kumar Ghosh.

So, my task was to make the slideshow video. It was fun. First, I tried several AIs such as Runway, Invideo, Adobe, Fliki, etc. Unfortunately, all are paid, and access to the free version is limited. Also, the generated video was so weird. Later, I tried to download the Wonder Share Filmora, but because of a trust issue with the cracked version, I just deleted the app and started looking for free apps. I use Microsoft clip camp, but there are not enough transitions and effects available; I tried, but it was not so satisfying, so again, I looked for another software. Then I remembered that a phone app is very popular with all the tiktokers. I don't make reels, but everywhere we can see that video is created with CapCut. Then, I downloaded the app to my laptop and edited the video. After some trial and error fixes, I made the video without audio. Then, I hand over the video to my groupmate for making the voiceover. After the generation of the voiceover, I rearrange the images to align them with the voiceover. Then, I again hand it over to my groupmate to select the background music. After the selection, I added the music and fixed the loudness with the help of my group mates. Finally, we successfully made the video.
